

## **IPS** Implants®

Cranium

Oral and maxillofacial surgery is our passion! We also want to continue our development along with our customers. Day in, day out, we work to develop innovative products and services that satisfy the highest quality demands and contribute to the patient's well-being.

## **IPS® – Individual Patient Solutions**

### **IPS Implants®** Cranium

Traumatic brain injuries, loss of bone integrity or reconstructions as a result of tumors, ulcers or cysts require restoration of the original shape and functions to restore the patient's quality of life.

Despite advances in reconstruction techniques, it has always been a challenge to reconstruct the skull in its original shape.

The use of modern technologies opens up new options in the treatment of complex defect situations. With the development of preoperative virtual planning as well as patient-specific implants, another possibility to achieve a true-to-origin contour of resected bone has been established. IPS® offers matched solutions for the computer-based planning of surgical procedures, the efficient design of customized treatment concepts and the realization of these concepts in the operating theater with functionalized implants and planning aids.

## Features, Functions and Benefits

IPS® is ideal for solutions customized to the patient by a simple and efficient process – from planning to the functional implant.

With IPS Gate®, we provide a platform which guides surgeons and users reliably and efficiently through the process of inquiring about, planning, and completing patient-specific products. The intuitive concept offers the user maximum mobility, flexibility, and functionality. With the "HTTPS" standard, IPS Gate® ensures encrypted data transmission, which is additionally certified by the TÜV Süd seal.

Patient-specific implants, planning aids, and anatomical models are made from various materials using state-of-the-art fabrication technologies. Thanks to computer-based planning and functionalized patient-specific implants, preoperative planning can be implemented in surgery with unprecedented precision.

The resulting advantages for patients are reduced complication rates, improved esthetic and functional results, shortened surgical time and faster rehabilitation.

# IPS Implants® Cranium

	Features and Functions	Benefits
<p><b>Planning process</b></p> 	<ul style="list-style-type: none"> <li>Simple and efficient interaction with the user via IPS Gate®</li> <li>Planning, fabrication, shipping from a single source</li> <li>Provision of three-dimensional planning data</li> <li>Planning time 5-7 working days</li> </ul>	<ul style="list-style-type: none"> <li>Maximum mobility, flexibility and functionality</li> <li>Complete service with the requirement for coordinating multiple services eliminated</li> <li>High degree of safety in planning</li> <li>Save time with efficient case processing</li> </ul>
<p><b>Drilling and marking guides</b></p> 	<ul style="list-style-type: none"> <li>Enable transfer of virtual planning to the OR</li> <li>In cranial reconstruction: enable precise determination of the implant position</li> <li>For the correction of congenital malformations: integration of bone rearrangement in one or more marking guides</li> <li>Manufactured from polyamide</li> </ul>	<ul style="list-style-type: none"> <li>High planning and implementation reliability</li> <li>Exact fit of the implant on the defective area</li> <li>Positioning aid for the correct arrangement of the bone segments</li> <li>High biocompatibility</li> </ul>
<p><b>Implant</b></p> 	<ul style="list-style-type: none"> <li>High variety of materials</li> <li>Option of overlapping the defect or covering it with a perfect fit</li> <li>Latest production technologies such as additive manufacturing</li> <li>High-performance polymer PEEK (polyether ether ketone)</li> <li>Titanium mesh and solid titanium</li> <li>Implant based on the individual CT scan of the patient, already checked for perfect fit ex-works</li> </ul>	<ul style="list-style-type: none"> <li>Wide range of choices within the context of best possible patient care</li> <li>Additive manufacturing technology provides complete freedom of design for implants</li> <li>Maximum flexibility and stability</li> <li>Physical properties similar to those of human cortical bone</li> <li>Intraoperative adjustment possible if required</li> <li>High implant stability</li> <li>Cost-effective alternative through patient-specific preforming of the implant</li> <li>No sharp edges, as cutting or bending to size is no longer necessary</li> </ul>

## Step by Step to Optimal Treatment

### Indications

Cranial reconstructions due to infections, tumors, cysts or rejection reactions.

Restoration of form and function following trauma.

Correction of congenital deformities (craniofacial malformations).

- Cranial reconstruction with
- Additively manufactured titanium implant (AMTi)
  - PEEK implant
  - Standard titanium mesh
  - Standard solid titanium

(optional: use of a drilling and marking guide)

Correction of craniofacial malformations using drilling and marking guides

## Surgical Technique

**Cranial reconstruction with PEEK implant and drilling and marking guide**

Pages 10-11

### Virtual planning

To create the case the patient data and other case-related information are uploaded to the web-based platform IPS Gate®.

The data is prepared for case planning on the basis of the user's requirements and information. An integrated chat function and web meetings are available for direct communication between the IPS® developer and user.

In consultation with the user, the defective regions are identified and the resection limits defined.

Then the drilling and marking guide and a case-specific optimized implant are created. The type, diameter and size of the implant are defined exactly according to the user's wishes and are based on anatomical and clinical conditions.

At the end the user approves the design for production.

*Note:*

*More detailed information on how to prepare patient data for virtual planning can be found in our brochure "IPS Implants® Scan Protocol Cranium / Midface / Midface Orbita / Mandible / Mandible Reconstruction".*

### Resection of the defective region

To prepare the cranial vault, the drill and marking guide is placed and fixed.

This specifies the resection lines and angles for the preparation and resection of the defect. For example, marking can be performed with a piezo device.

Then the drilling and marking guide is removed and the resection performed along the marked line.

#### **Placement of the implant**

After the defective region has been prepared using a drill and marking guide, the IPS® implant is placed as a next step.

Based on the information stored in the drilling and marking guide, a fit with millimeter precision can be guaranteed.

#### **Fixation of the implant**

The IPS® implant is fixated to the native bone with osteosynthesis screws (e.g. 1.5-mm maxDrive® Drill-Free screws).

PEEK implants can also be fixated with osteosynthesis plates (e.g. with 1.5-mm Low Profile Neuro System).

#### *Note:*

*In addition to the IPS® implant and the included drilling and marking guides, the required osteosynthesis accessories (KLS Martin osteosynthesis screws and plates in the planned diameters and lengths as well as the corresponding screw-driver and, if applicable, twist drill ) must be available in sterile condition. They are not included in the IPS® package.*

Cranial reconstruction with additively manufactured titanium implant  
*Restoration with laser-sintered titanium implant with osteo-conductive mesh structure*

Cranial reconstruction with PEEK implant  
*Restoration with perforated PEEK implant to enable connective tissue ingrowth*

Cranial reconstruction with titanium mesh  
*Restoration with patient-specific preformed titanium mesh*

Cranial reconstruction with solid titanium  
*Restoration with patient-specific preformed solid titanium*

Cranial reconstruction with a solid PEEK implant  
*Restoration with unperforated PEEK implant with drilling and marking guide for precise resection of the defect*

Correction of craniofacial malformations  
*Restoration using additively manufactured drilling and marking guides made of polyamide*

## Osteosynthesis Accessories

In addition to the IPS® implant and/or the included drilling and marking guides, the following osteosynthesis accessories are required:

- Sufficient number of KLS Martin osteosynthesis screws in the planned diameters (1.5 mm) for fixating the implant and drilling and marking guides.
- When using a PEEK implant: sufficient number of KLS Martin osteosynthesis plates (e.g. Low Profile Neuro System 1.5 mm or Level One 1.5-mm Micro System).
- A screwdriver to fit the planned osteosynthesis screws.
- If no Drill-Free screws are used: a twist drill suitable for the planned osteosynthesis screws.

## The IPS® Product Range

### IPS CaseDesigner®

The IPS CaseDesigner® makes virtual 3D surgical planning easier and faster than ever before. With this flexible software tool, orthognathic procedures can be efficiently and reliably planned and simulated, and then applied to treatment in the operation in a customized manner.

### IPS Gate®

The web-based platform and app guide surgeons and users reliably and efficiently through the process of inquiring about, planning, and completing patient-specific products. With the HTTPS standard, IPS Gate® ensures encrypted data transmission, which is additionally certified by the TÜV Süd seal.

### IPS Implants®

Patient-specific implants, planning aids, and anatomical models are made from various materials using state-of-the-art fabrication technologies. Due to computer-based planning and functionalized patient-specific implants, preoperative planning can be implemented in surgery with unprecedented precision.
